

A personal CRM for any life project

You talk, your agent builds. A plain guide to turning one spreadsheet into a private dashboard, a public page and a CV.

Contents

What you get

Meet Maya

The pieces

Start: one prompt

STEP 1 **Talk**

STEP 2 **Goals**

STEP 3 **Choose**

STEP 4 **Store**

STEP 5 **Publish**

STEP 6 **Your assistant**

STEP 7 **Handoff**

STEP 8 **Keep it running**

Privacy and honesty

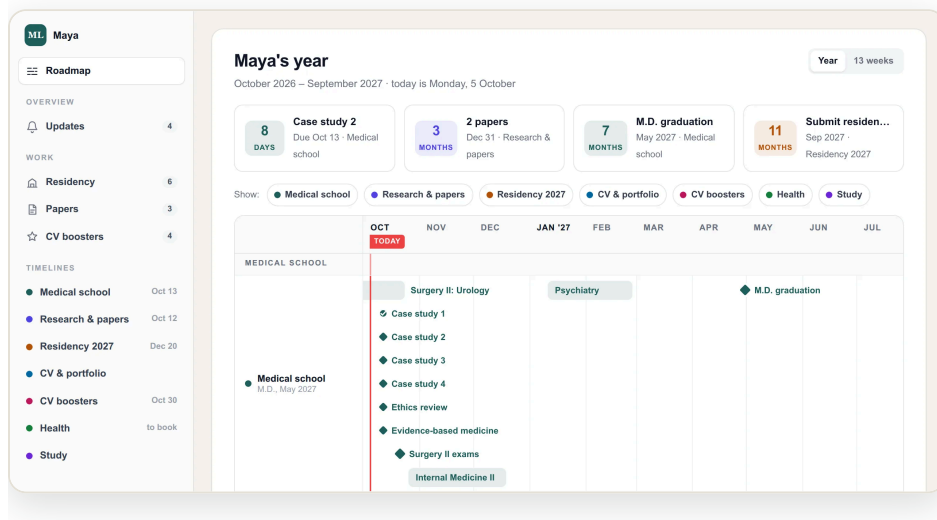

Maya, the medical student in this guide, is fictional. Every name, school and date is made up.

What you get

A personal CRM is a place where one project of your life stops being scattered. Instead of deadlines in your head, documents in five apps and a to-do list you forgot about, you get:

- **One spreadsheet** in your own Google Drive, holding every date, step and list. You can open and edit it like any spreadsheet.
- **A private dashboard:** a website only you can log into. It shows your whole project on one timeline, what is coming up next, and pages for the lists you compare (programs, bills, test results).
- **A public page and a CV**, if you want them. Made from the same spreadsheet, so they never go out of date.
- **A chat assistant that keeps it current.** You say “today I sent the application”, and it updates the spreadsheet. The websites follow on their own.

You do not need to code. An AI agent does the building; you talk, choose and confirm.

What it costs

THING	COST
The kit (this guide, the agent skill, the apps)	free, open source (AGPL-3.0)
Google Drive	free (your existing Google account)
Hosting the websites on Cloudflare	free plan
A web address of your own (<code>yourname.com</code>)	optional, about 10-15 USD a year
An AI agent	whatever you already pay for it

Your agent will always ask before anything that costs money.

What you need

- An **AI agent that can run commands on a computer**: for example Claude Code or Codex. A plain chat window is not enough for the setup (it is enough afterwards, for daily updates).
- A **Google account**.
- About **two hours**, spread over a few days: one conversation, a few choices, two logins.
- Optional: a free **Cloudflare account**, to put the websites online.

FOR MONEY OR HEALTH

the same kit works. A money CRM tracks debts, savings goals, bills and tax dates; a health CRM tracks check-ups, results and training plans. See both live at life-crm.jerryfane.com.

Meet Maya

Maya Lindqvist is a medical student in her final year. She is **made up**: every name, school, hospital and date in her setup is invented. But her setup is complete and real, and it is where your agent starts when it designs yours.

Her year has a lot going on at once: clinical rotations with exams and assignments, two research papers she wants published before applying, a list of residency programs to compare, electives and certificates to strengthen her CV, letters from supervisors, and health check-ups she keeps postponing.

Her dashboard

Each part of her project is a **lane** on the roadmap: Medical school, Research & papers, Residency 2027, CV, CV boosters, Health, Study. Inside each lane, **bars** are periods (a rotation), **diamonds** are deadlines (an exam), and **tasks** are things to do. The cards at the top count down to what matters next.

Lists she compares get their own pages. Residency programs are a **table** she can sort by fit, deadline and status:

Her papers are **cards**, and an **update log** shows what got done, newest first. It works on a phone too:

Her public page and CV

From the same spreadsheet: a one-page site with her education, rotations, research and certificates, and a CV as a PDF. Her phone number is only in her own copy of the CV, never on the page or in the CV visitors can download.

Maya Lindqvist

M.D. Candidate · Coastline University College of Medicine
Port Seren

[Email](#)
[LinkedIn](#)
[Download CV](#)

Medical student at Coastline University College of Medicine (M.D. expected May 2027) with a B.S. in Biology from Northvale University. Core clerkships in surgery, internal medicine, obstetrics & gynecology, pediatrics, otorhinolaryngology and ophthalmology at Harbor View Teaching Hospital, with clinical electives in emergency medicine and family medicine in the United States. Research experience in clinical biomarkers.

EDUCATION

Doctor of Medicine (M.D.)

Coastline University College of Medicine · Port Seren

2023 – May 2027 (expected)

Bachelor of Science, Biology

Northvale University · Northvale

2017 – 2021

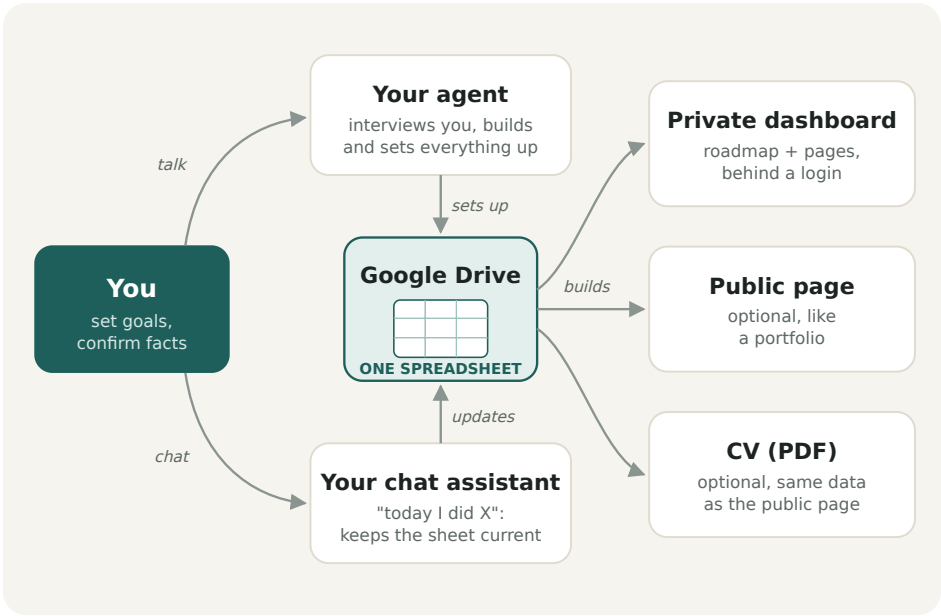

Try it

Open life-crm.jerryfane.com and click around. In real life the dashboard sits behind a login; Maya's is open because nothing in it is real.

FOR MONEY OR HEALTH

the demo also has a money dashboard (car loan, emergency fund, bills, taxes) and a health dashboard (check-ups, lab results, a training plan). Same pieces, different lanes and pages.

The pieces

PIECE	WHAT IT IS	MAYA'S
You	Set the goals, confirm every fact	Maya
Your agent	The AI that interviews you and builds everything	A coding agent on her laptop
Storage	Where your data lives, readable by you	One Drive folder with one spreadsheet
Dashboard	Private website made from the spreadsheet	Roadmap, programs, papers, boosters, updates
Public page + CV	Optional, made from the same spreadsheet	Her portfolio page and PDF CV
Login	The lock in front of the dashboard	A Cloudflare login: only her email gets in
Chat assistant	The AI you talk to every day	Her phone's chat app, connected to Drive

Why one spreadsheet

Everything reads from it and nothing else holds the truth. That has three good effects:

1. **You can always see and fix your data** without any app. It is just a spreadsheet.
2. **Nothing gets out of sync.** Change a date once; the dashboard, page and CV follow.
3. **You are not locked in.** If you stop using the websites, the spreadsheet is still yours.

Why your agent asks so many questions

Because it must not guess. Every date, grade and name in your sheet comes from you or your documents, and you confirm it. An empty cell is better than a plausible wrong one, especially in anything you will send to a school, an employer or a bank.

Start: one prompt

Open your AI agent on your computer and paste this:

PASTE THIS

I want a personal CRM for a project in my life. Download <https://github.com/jerryfane/life-crm> (git clone, or the ZIP), read skill/SKILL.md, and follow it step by step with me. I am not a developer: ask me one thing at a time, show me options to choose from, and explain anything I need to click. Start with step 1.

From here on, your agent leads. The next eight pages show what happens at each step, what you do, and what your agent does, so nothing surprises you.

STEP	YOU END UP WITH	YOUR TIME
1 Talk	Your project in your own words	20 minutes
2 Goals	A short goal list you agreed to	10 minutes
3 Choose	A dashboard design you picked by clicking	20-30 minutes
4 Store	Your Drive folder and spreadsheet	15 minutes + checking
5 Publish	Your dashboard online, behind a login	15 minutes
6 Your assistant	Daily updates by chat	10 minutes
7 Handoff	Everything on your phone	10 minutes
8 Keep it running	Updates arrive on their own	5 minutes

You can stop after any step and continue another day. Your agent keeps notes in a **work** folder on your computer, so it can pick up where you left off; they are never uploaded. It always asks before anything that costs money, creates an account, or shows something to others.

Talk

Everything starts with a conversation about your project. Talking is faster than typing, and it brings up things you would never write down: the letter you still have not asked for, the certificate somewhere in your email.

YOU

record yourself for 10-20 minutes, alone or with someone who knows your plans. Turn it into text with any voice-to-text tool (your phone's voice memos, a transcription app, or your chat assistant) and give the text to your agent. Or, if you prefer, answer its questions in the chat, one at a time.

YOUR AGENT

sends you a short list of questions to talk through, reads the whole transcript, and then asks only about what is missing: dates, documents, people.

Questions it will ask you about, in some form:

- What are you trying to achieve, and by when?
- What are the big parts of it?
- Which dates do you already know?
- What is waiting on someone else?
- Where do your documents live today?
- Who else should see the dashboard, if anyone?

You do not need exact answers. "Spring 2027" is fine; it shows as approximate on the dashboard until you know more.

FOR MONEY

talk about debts and their rates, savings goals, bills and when they come, tax dates, contracts that renew. You decide whether amounts go in at all.

FOR HEALTH

talk about check-ups that are due, results you want to follow, a habit or a race you are training for. You decide how much detail is stored: titles only ("Dentist") is a fine choice. Health never appears on a public page.

Goals

Your agent turns the conversation into a short list of goals, in your words. Everything it builds later is checked against this list.

YOUR AGENT

writes 3-7 goals, each with the parts that lead to it and the dates you know, plus a “not now” list and the questions still open. It sends you the list and asks what is missing or wrong, and which goal matters most right now.

YOU

read it and correct it until it is right. Say yes when it is.

Maya’s list looked like this:

EXAMPLE

1. **Match into a residency program**, applications open Sep 2027. Parts: residency applications, CV, CV boosters, research.
2. **Graduate in May 2027**. Parts: rotations, assignments, exams, study.
3. **Publish two papers** before applying. Parts: research.
4. **Stay on top of health check-ups** (titles only).

Not now: moving plans, finances.

Each **part** usually becomes a lane on your dashboard. If your list grows past seven goals, your agent will ask which can wait: a dashboard with fifteen lanes gets ignored.

FOR MONEY

“Pay off the car loan by June 2027”,
 “Three months of expenses saved”,
 “Never miss a bill”, “Taxes filed by April”.

FOR HEALTH

“All check-ups done this year”, “Vitamin D back to normal”, “Run a 10K in the spring”.

Choose

Most people cannot say what they want from a dashboard until they see two versions side by side. So your agent does not describe designs: it builds three or four real ones and lets you click through them.

YOUR AGENT

starts from Maya's setup and asks a few quick questions with options: which lanes, which lists deserve their own page, whether you want a public page, who else sees the dashboard. Then it builds 3-4 versions of your dashboard and one page to switch between them.

YOU

click around in each version, on your phone too if you will mostly use it there. Tell your agent which feels closest and what you would change. A second, smaller round usually settles it.

Three ways to set up Maya's dashboard

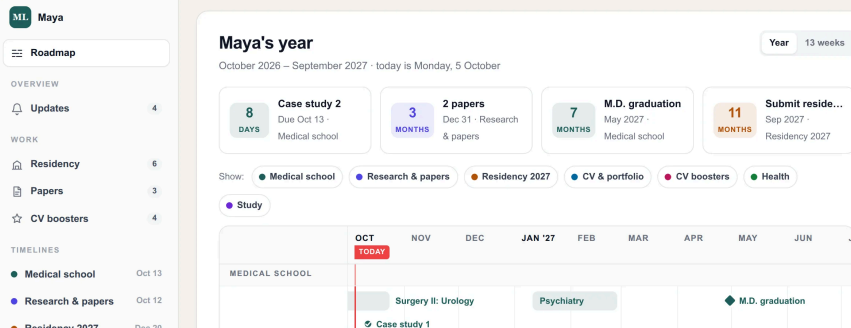

Same data, different layouts. Click around in each, then say which feels right.

A · Grouped

B · One group, 6 months

C · Public page

Lanes grouped by area. [Open full screen ↗](#)

What the versions differ in, for example:

CHOICE	OPTION A	OPTION B
Lanes	grouped by area	one lane per goal
A list	a table (compare many details)	cards (fewer, richer items)
Roadmap	12 months (overview)	6 months (detail)
Update log	yes	no

The versions use your confirmed facts where they exist. Anything else is a clearly marked sample row starting with “Example:”. Maya’s facts never end up in your sheet.

FOR MONEY

the choices are usually which lists get pages (bills, accounts, subscriptions) and whether amounts are shown.

FOR HEALTH

usually whether results get their own page, and whether appointments sit in one lane or one lane per type (dentist, doctor, eyes).

Store

Your data moves into your own Google Drive: one folder, subfolders for documents, and one spreadsheet. From now on that spreadsheet is the single source of truth.

YOU

open a link your agent sends you and log in to Google (about 2 minutes). If you have never used Google Cloud, also open console.cloud.google.com once and accept the terms. Then check the spreadsheet your agent made and correct anything wrong. Move or send the documents that matter.

YOUR AGENT

connects to your Drive with a small tool called drivekey, creates the folder (for example “Maya CRM”) and subfolders, fills the spreadsheet with your confirmed facts only, and walks you through its tabs.

What the login allows: your agent can read and change files in your Drive. It only works inside the folder it creates, and you can switch it off any time at myaccount.google.com/permissions.

The spreadsheet

TAB	WHAT IT HOLDS
Timelines	the lanes of your roadmap: name, color, goal
Steps	every period, deadline and task, with dates and status
Settings	the dashboard title and how many months it shows
Collections	which extra pages exist (one row per page)
one tab per page	the list itself: programs, bills, results, ...
Profile, Entries	only with a public page: your details and CV lines

You can edit any cell yourself. Dates are written like `2027-05-14` , or just the month (`2027-05` or `May 2027`) if you do not know the day. Set `show` to `no` to hide a row

without deleting it.

FOR MONEY

typical subfolders are Statements, Taxes, Contracts, Receipts. Never store passwords or full account numbers in the sheet.

FOR HEALTH

typical subfolders are Results, Prescriptions, Insurance. Results stay private: they never reach a public page.

Publish

Your agent builds your dashboard (and public page and CV, if you chose them) from the spreadsheet, shows them to you, and then puts them online on your own free Cloudflare account.

YOUR AGENT

builds everything on your computer first and shows you. Then it publishes the public page, and uploads a **locked** placeholder for the dashboard, with no data in it, until the login is on. It guides you through turning the login on, then uploads the real dashboard and checks that a stranger only sees a login page.

YOU

create a free Cloudflare account (or use yours) and log in once. Turn on the login for your dashboard, about 10 minutes the first time, with your agent guiding you. Then open both sites on your phone.

The login

Cloudflare calls it **Access**. At first only you can enter: you sign in with the email of your Cloudflare account and Cloudflare sends you a one-time code. No password to remember. If someone else should see the dashboard, your agent shows you where to add their email address.

The first time, Cloudflare asks you to set up “Zero Trust” and pick its **Free** plan. It may ask for a payment card even for the free plan; your agent will tell you before, and you decide.

Addresses

OPTION	LOOKS LIKE	COST
Free address	<code>maya-crm.yourname.workers.dev</code>	free
A domain you own	<code>crm.maya.com</code>	free if you already have it
Buy a domain	<code>mayalindqvist.com</code>	about 10-15 USD a year, you buy it

Check the public page together

Read it line by line with your agent. Your phone number is never on it, not even in the CV you can download there (only your own copy of the CV has it), but anything written in your CV lines is public. Nothing about health, money, ID numbers or other people's private details belongs there.

No Cloudflare? The dashboard also works as a file on your computer: open it in any browser, even offline. It just does not update itself.

Your assistant

After setup you should not need your agent day to day. Instead, you chat with the AI assistant you already use (on your phone, for example), and it keeps the spreadsheet current.

YOUR AGENT

writes a guide file for your assistant and puts it in your Drive folder. It explains each tab and column of *your* sheet, what the assistant may change on its own, what needs your yes first, and the rules: never invent facts, keep private things private. Then it tests the assistant with you.

YOU

connect your chat assistant to Google Drive (most have a Drive connector in their settings) and add one instruction: *"Before answering about my CRM, read GUIDE.md in my Maya CRM folder."* Then send two test messages.

The two tests

PASTE THIS

What are my next three deadlines?

PASTE THIS

Today I finished the Surgery II assignment.

The first should list real dates from your sheet. After the second, the task should be marked done, and an update row added. Your agent checks the sheet and fixes the guide if the assistant got it wrong.

What your assistant may do

ON ITS OWN	ONLY AFTER YOUR YES
Mark a step done when you say so	Anything that appears on your public page
Add a step with a date you gave	Deleting rows
Add an update to the log	New lanes, pages or columns

Some assistants can read Drive but not edit it. They can still answer questions and suggest the exact change; you paste it into the sheet.

Handoff

Your agent hands everything over, so you can use your CRM without it.

YOUR AGENT

writes a one-page *MY-CRM* note in your folder with every link (sheet, dashboard, public page, CV, folder) and three short “how to” sections. It shows you the three things below on your phone, explains what access it still has and how to remove it, and asks what is missing or too much.

YOU

follow along on your phone, and say whether the agent should keep its access for upkeep.

On your phone

1. Open your dashboard, log in, and add it to your home screen (Share → Add to Home Screen on iPhone; menu → Add to home screen on Android).
2. Tell your assistant something you did today.
3. Watch the change appear on the dashboard after the update delay.

Removing access, any time

ACCESS	HOW TO REMOVE IT
Your agent's Google Drive login	myaccount.google.com/permissions → “Google Cloud SDK” → remove
Your agent's Cloudflare access	delete the API token, if you created one
Your assistant's Drive access	the assistant's connector settings

Your spreadsheet, documents and websites stay yours whatever you remove.

Keep it running

Your websites are rebuilt from the spreadsheet with one command. The last choice is how often that runs.

OPTION	GOOD FOR	WHAT YOU NEED
When you ask	trying it out; laptops that sleep	ask your agent “update my sites”
Every hour on your computer	a computer that is often on	a scheduled task your agent sets up
On an always-on machine	updates even when your laptop is off	a home server, or a small cloud machine (costs money: you decide)

YOUR AGENT

sets up the option you chose, checks the first runs, and tells you what to do if a login expires (log in again; it takes a minute).

YOU

make one test edit in the sheet and check it reaches the dashboard.

Every update checks that the dashboard's login is still on. If it is not, the dashboard is replaced by the locked page instead of showing your data.

Changing things later

Most changes need no code, because the structure lives in the spreadsheet too:

YOU WANT	CHANGE
a new part of your project	a row in Timelines
a new list (apartments, venues, scholarships)	a row in Collections and a new tab
a column on a page	that page's row in Collections
a longer or shorter roadmap	Settings

Your assistant can do the small ones. For bigger ones, ask your agent: it will show you options again, like in step 3.

Privacy and honesty

These rules are built into the agent skill. Knowing them helps you notice if something goes wrong.

RULE	WHAT IT MEANS FOR YOU
Only real facts	Your agent and assistant never fill gaps with guesses. Unknown stays empty until you know.
Your accounts	Your files live in your Drive, your sites in your Cloudflare account. Nothing goes into someone else's.
Private stays private	Health, money, phone, address, ID numbers and other people's details never go on the public page.
Dashboard behind a login	Your data is only uploaded once the login is on, and every update checks it again.
Ask first	Nothing that costs money, creates an account or shows something to others happens without your yes.
You can leave	Your spreadsheet works without any of this. Remove access any time (step 7).

Questions

Can someone find my dashboard? They can find the address, but only the emails you allowed get past the login.

Is my data used to train AI? That depends on the AI agent and chat assistant you use, not on this kit. Check their settings.

What if the agent makes a mistake in my sheet? Google Sheets keeps a version history (File → Version history), so any change can be undone.

Can I use this for two projects? Yes: one folder and spreadsheet per project, or several lanes in one. Ask your agent which fits.

I am a developer. The apps, the spreadsheet format and the skill are documented in the repository: github.com/jerryfane/life-crm.
