

A personal CRM for any life project

Paste one prompt into your AI agent. It interviews you, then builds a private dashboard, a public page and a CV from one spreadsheet you own.

PASTE THIS INTO YOUR AGENT

I want a personal CRM for a project in my life. Download <https://github.com/jerryfane/life-crm> (git clone, or the ZIP), read skill/SKILL.md, and follow it step by step with me. I am not a developer: ask me one thing at a time, show me options to choose from, and explain anything I need to click. Start with step 1.

What life-crm is

Some projects have too many moving parts to keep in your head: applying to residency, getting out of debt, moving abroad, staying on top of your health. Dates live in emails, documents in five apps, to-dos in your head, and something always slips.

A CRM is what companies use to keep track of every customer, deal and next step. life-crm is the same idea for one project of your life: one place that knows every date, document and next step, and shows it back to you clearly.

You do not build it yourself. You paste one prompt into an AI agent, and it interviews you, proposes a setup, and builds it with you. You talk, choose and confirm; you never write code.

One spreadsheet

In your own Google Drive. It holds every date, step and list: the only place the truth lives. You can open and edit it like any spreadsheet.

A private dashboard

A website only you can log into. Your whole project on one timeline, countdowns to what is next, and pages for the lists you compare.

A public page and CV

Optional. A one-page portfolio and a PDF CV made from the same sheet, so they never go out of date.

A chat assistant that keeps it current

The AI you already chat with on your phone. “Today I sent the application” updates the sheet, and the websites follow.

MEET MAYA

This guide follows Maya, a medical student applying to residency. She is fictional: every name and date is made up. Her complete setup is live at life-crm.jerryfane.com, and your agent uses it as the starting point for yours.

The big picture

Seven pieces work together. You only talk to two of them: your AI agent while setting things up, and your chat assistant every day after that.

HOW TO READ IT

Follow the spreadsheet in the middle. Your agent builds it, your chat assistant keeps it current, connectors bring facts into it, and the website shows it back to you.

Everything below the line is private; only the optional public page sits above it.

Each piece, explained

PIECE	WHAT IT IS	IN MAYA'S CASE
Human	You. You set the goals and confirm every fact. Nothing goes in the sheet that you did not say or a document does not show.	Maya, talking about her residency plans.
Engine	An AI agent that can run commands on a computer: it installs tools, writes files, builds websites. You use it to set things up and for bigger changes later.	Claude Code on her laptop. Codex works too.
Repo	The engine's workspace: a folder on your computer holding its notes and the building tools. Optionally backed up on GitHub.	A <code>life-crm</code> folder with a <code>work</code> subfolder.
Storage	One folder in your Google Drive with one spreadsheet and your documents. The single source of truth: every other piece reads from it or writes to it.	"Maya CRM": the sheet, plus folders for CV, certificates, letters.
Interface	Your everyday chat assistant, connected to your Drive. You tell it what happened; it updates the sheet. See the next page.	A chat app on her phone.
Website	Built from the spreadsheet: a private dashboard, plus an optional public page and CV.	Her roadmap dashboard and her portfolio page.
Login	A Cloudflare login in front of the dashboard. Only the email addresses you allow get in; strangers see a login page.	Only Maya's email.
Connectors	Where facts come from: email, calendar, a fitness tracker. Your assistant or agent reads them when you ask, never on its own.	Her school email and calendar.

Your personal chat assistant

Your agent builds things; your chat assistant keeps them current. It is the AI you already talk to on your phone or laptop: the ChatGPT, Claude or Gemini app, or a bot in WhatsApp or Telegram. Once it is connected to your Google Drive, it can read and update your spreadsheet.

Your agent writes a short guide file into your Drive folder (step 6). It tells your assistant which tab is which, what it may change on its own, and what needs your yes first. Your assistant reads it before answering anything about your project.

What a day looks like

Today I submitted the Riverside application, and Dr. Navarro agreed to write my letter.

Done: Riverside is now “applied” in Programs, and “Letter from Dr. Navarro” is marked done in Steps. I added both to your update log. Your next deadline is the Lakeshore application on 1 November.

What do I still need for Lakeshore?

From your sheet: a personal statement (not started) and your exam score report (status “to book”).

Good to know

- It answers from your sheet, not from memory, so the answers are only as good as the sheet. Tell it when things happen.
- Some assistants can read Drive but not edit it. They can still answer, and tell you exactly what to change.
- Your agent sets this up with you and tests it with two messages before you rely on it.

Before you start

YOU NEED	WHY
An AI agent that can run commands	Claude Code, Codex or similar, on your computer. It does all the technical work. A plain chat window is not enough for the setup.
A Google account	Your spreadsheet and documents live in your own Google Drive.
About two hours	Spread over a few days: one conversation, a few choices, two logins. You can stop after any step.
A free Cloudflare account	Optional, to put the websites online. Without it the dashboard still works as a file on your computer.

WHAT IT COSTS	
life-crm itself	Free and open source (AGPL-3.0)
Google Drive, Cloudflare	Free plans are enough
Your own web address	Optional, about 10-15 USD a year, and you buy it yourself
The AI agent	Whatever you already pay for it

HAVE READY

A list of what you want to keep track of (or just a voice memo about it), and the documents that matter: certificates, letters, statements, results. They can be scattered; sorting them is part of the work.

SEE IT FIRST

life-crm.jerryfane.com shows a complete setup for Maya, a medical student. She is fictional: every name and date is made up. Click around before you start; your agent will use her setup as the starting point for yours.

Step 1 • Talk

Open your AI agent and paste the prompt from the cover. Its first question is how you want to start. Everything begins with you describing your project in your own words.

YOU	Talk for 10-20 minutes about your project: what you want, by when, what is in the way, where your documents are. Then give your agent the text. If you prefer, answer its questions in the chat one at a time instead.
AGENT	Sends you a short list of things to talk about, reads everything you say, then asks only about what is missing.
EXPECT	Follow-up questions like “when is that, roughly?” or “who decides that?”. “Spring 2027” is a fine answer.

The easiest way: dictate

Talking is faster than typing, and it brings up things you would never write down: the letter you still have not asked for, the certificate buried in your email. A dictation app turns your voice into text in any app. **Wispr Flow** (wisprflow.ai, free plan available, Mac, Windows, iPhone, Android) works well: hold a key, talk, and the text appears in your agent’s chat. Your phone’s voice memos plus any transcription app work too.

What to talk about

- What are you trying to achieve, and by when?
- What are the big parts of it?
- Which dates do you already know: deadlines, appointments, starts and ends?
- What is waiting on someone else right now?
- Where do your documents live today?
- Who else should see your dashboard, if anyone?

EXAMPLE (MAYA)

“I’m in my last year of med school, graduating May 2027. I want to match into residency, applications open in September. I need two papers published before that, I have one draft. I still need letters from three supervisors, Dr. Navarro said yes...”

Step 2 • Goals

A goal is something you want to have done by a certain time: “match into a residency program by 2027”, “pay off the car loan by June”. Your agent turns your talk into a short list of them. Everything it builds later is checked against this list.

- YOU** Read the list. Correct anything wrong or missing, and say which goal matters most right now.
- AGENT** Writes 3-7 goals in your words. Under each, the parts that lead to it and the dates you mentioned. Plus a “not now” list and the questions still open.
- EXPECT** A message like the one below, then a few rounds of “change this” until you say yes.

EXAMPLE (MAYA)

1. Match into a residency program, applications open Sep 2027. Parts: applications, CV, CV boosters, research. **2. Graduate in May 2027**. Parts: rotations, assignments, exams, study. **3. Publish two papers** before applying. Parts: research. **4. Keep up with health check-ups**, titles only. Not now: moving plans, finances. Open question: the date of the Surgery II exam (ask the school).

Why it matters

Each **part** becomes a lane on your dashboard’s roadmap: one row per part of your project, across the months. Each **date** becomes a bar (a stretch of time), a diamond (a deadline) or a to-do.

KEEP IT SHORT

If the list grows past seven goals, your agent will ask which can wait. A dashboard with fifteen lanes gets ignored.

OTHER PROJECTS

Money: “Car loan paid off by June 2027”, “Three months of expenses saved”, “Taxes filed by April”. Health: “All check-ups done this year”, “Run a 10K in the spring”.

Step 3 • Choose

Now you decide what your dashboard shows and how it looks. You do not design anything: your agent proposes, you pick.

- YOU

Answer a few quick multiple-choice questions, then click through the versions it sends and say which feels closest and what you would change.
- AGENT

Starts from Maya’s setup and adapts it to your goals on its own. It builds 3-4 real, working versions of your dashboard and one page with buttons to switch between them, then sends you the link (or screenshots).
- EXPECT

One or two rounds. The versions show your confirmed facts; anything else is a sample row starting with “Example:”.

What you choose

CHOICE	WHAT IT MEANS	EXAMPLE QUESTION
Lanes	The rows of your roadmap, one per part of your project.	“Maya has 7 lanes. For you I’d make these 5. Add, merge or drop any?”
Lists	Things you compare get their own page, as a table or as cards.	“Should the apartments you are looking at be a page? Table or cards?”
Time span	How many months the roadmap shows at once.	“12 months for the overview, or 6 for more detail?”
Public page	Whether you also want a portfolio page and a CV.	“Only the private dashboard, or a public page too?”
Who sees it	Only you, or also a partner, parent or coach.	“Should anyone else be able to log in?”

LOOK ON YOUR PHONE TOO

If you will mostly check it on your phone, open the versions there before you pick. Everything works on a phone.

Step 4 • Store

Your data moves into your own Google Drive: one folder, subfolders for documents, and one spreadsheet. From now on that spreadsheet is the single source of truth.

- YOU

Open a link your agent sends and log in to Google (about 2 minutes). If you have never used Google Cloud, also open console.cloud.google.com once and accept the terms. Then check the spreadsheet and correct anything wrong.
- AGENT

Connects to your Drive with a small tool called `drivekey`, creates the folder and subfolders, fills the spreadsheet with your confirmed facts only, and walks you through its tabs.
- EXPECT

A folder like “Maya CRM” in your Drive. Nothing outside it is touched. You can switch the access off any time at myaccount.google.com/permissions.

Your spreadsheet

TAB	WHAT IT HOLDS
Timelines	The lanes of your roadmap: name, color, goal.
Steps	Every stretch of time, deadline and to-do, with dates and status (to do, doing, done).
Collections	Which extra pages exist, one row per page.
One tab per page	The list itself: programs, papers, bills, results.
Settings	The dashboard title and how many months it shows.
Profile, Entries	Only with a public page: your details, and one row per line of your CV.

EDITING IT YOURSELF

Any cell can be changed by hand. Dates are written like 2027-05-14, or just the month (2027-05) if you do not know the day. Set “show” to “no” to hide a row without deleting it.

Step 5 • Publish

Your agent builds the websites from your spreadsheet and shows them to you on your computer. Then it puts them online for free on Cloudflare, a large hosting company, with a login in front of your dashboard.

- YOU** Create a free Cloudflare account (or use yours) and log in once. Turn on the login with your agent guiding you, about 10 minutes the first time. Then read your public page line by line.
- AGENT** Publishes the public page, and a locked page with no data for the dashboard. Once the login is on, it uploads your real dashboard and checks that a stranger sees only a login page.
- EXPECT** You sign in with your email; Cloudflare emails you a one-time code. No password to remember.

Addresses

You do not need to buy a domain. Every site gets a free address like **maya-crm.yourname.workers.dev**. If you already own a domain, your agent can use it; if you want to buy one (about 10-15 USD a year), it will ask first, and you buy it yourself.

Why Cloudflare

It is the free option that can put a real login in front of a private website. Other free hosts can publish a site, but keeping it private needs a paid plan. The first time, Cloudflare asks you to set up “Zero Trust” (its name for the login service) and to pick the free plan. It may ask for a payment card even for the free plan; your agent tells you before, and you decide.

NO CLOUDFLARE?

The dashboard also works as a file on your computer. Open it in any browser, even offline. It just does not update itself.

Steps 6-8 • Hand it over

6 Assistant

- YOU** Connect your chat assistant to Google Drive (most have a Drive connector in their settings) and give it one instruction: "Before answering about my CRM, read GUIDE.md in my Maya CRM folder." Then send two test messages.
- AGENT** Writes that guide file, tailored to your sheet, and checks the results of your tests.
- EXPECT** "What are my next three deadlines?" lists real dates. "I finished the assignment" marks it done.
-

7 Handoff

- YOU** Open your dashboard on your phone and add it to your home screen.
- AGENT** Leaves a one-page note in your folder with every link, and shows you how to remove its access to your Drive and Cloudflare.
- EXPECT** From here on you can use everything without your agent.
-

8 Keep going

- YOU** Choose how updates reach the websites: when you ask your agent, or automatically every hour on a computer that is often on.
- AGENT** Sets it up and checks the first runs.
- EXPECT** Change the sheet, and the dashboard follows within the time you chose. Every update checks again that the login is still on.

LOGINS YOU WILL DO

Google (step 4) and Cloudflare (step 5). Your agent never asks for your passwords, and you can remove its access at any time.

Using it day to day

The setup is done once. After that, your CRM is only useful if it stays current, and that takes seconds a day.

HABIT	HOW
Tell your assistant what happened	"Today I submitted the Riverside application." "My dentist appointment is 14 November." It updates the right row and tells you what it changed.
Ask it, too	"What is due this month?" "Which programs have I not applied to yet?" It answers from your sheet, not from memory.
Look at the dashboard	Once a day, on your phone. The cards at the top count down to what matters next; lanes show every part of the project over the months.
Fix problems where they show	If a row has a problem (a date it cannot read), the dashboard lists it in a yellow box at the bottom. Fix that cell in the sheet.
Change the structure in the sheet	A new part of the project is a new row in Timelines; a new list is a row in Collections plus a tab. Small changes your assistant can do; bigger ones, ask your agent.

WRITE DOWN FACTS, NOT GUESSES

If you do not know a date yet, leave it empty: the step shows under "to schedule". A wrong date is worse than an empty one.

UNDO IS ALWAYS THERE

Google Sheets keeps every version (File, then Version history), so any change can be rolled back.

Privacy, rules and questions

RULE	WHAT IT MEANS FOR YOU
Only real facts	Your agent and assistant never fill gaps with guesses. Unknown stays empty.
Your accounts	Files in your Drive, sites in your Cloudflare. Nothing goes into anyone else's.
Private stays private	Health, money, phone, address, ID numbers never reach the public page. Your phone number is only in your own copy of the CV.
Behind a login	Your dashboard data is uploaded only once the login works, and every update checks it again.
Ask first	Nothing that costs money, creates an account or shows something to others happens without your yes.

QUESTION	ANSWER
Not a career project?	Money (debts, savings, bills, taxes), health (check-ups, results, training), a move, a wedding: each part becomes a lane, each list a page.
Can someone find my dashboard?	They may find the address, but only the emails you allowed get past the login.
Is my data used to train AI?	That depends on the agent and assistant you use, not on life-crm. Check their settings.
Can I stop using it?	Yes. The spreadsheet is yours and works on its own.
